Contents

1 Introduction

PD-Intranet is an internal website we built for the Santa Barbara County Public Defender's Office. The idea is that each employee only sees the stuff that is relevant to their job instead of having access to everything at once.

2 Why This Software Matters

Before PD-Intranet, all employees had access to every office resource regardless of their role. This caused:

- Information overload for staff who did not need certain resources
- Security and compliance risks from unrestricted access to sensitive content
- Manual permission management that was slow and error-prone
- Delays when employees changed roles or departments

PD-Intranet solves this by giving each employee a personalized view of only the tools and resources relevant to their job, with permissions managed automatically through Azure Active Directory.

3 Goals

- Reduce manual permission management
- Improve resource accessibility for all staff
- Enhance productivity with personalized dashboards
- Ensure secure, role-based access to sensitive information

4 Objectives

- Implement role-based access control for 9 user roles
- Automate permission sync using Azure Active Directory
- Build modular SharePoint web parts for each department
- Deploy an office hoteling and attorney workload dashboard

5 Jira

<https://cs3338-group-10.atlassian.net/jira/software/projects/CSLDGS/boards/2>

6 How to Access

1. Clone the repository from GitHub
2. Install dependencies: `npm install`
3. Build the SPFx solution: `gulp bundle --ship && gulp package-solution --ship`
4. Deploy the `.sppkg` file to the SharePoint App Catalog
5. Access the platform via your SharePoint site
