

PD-Intranet: Role-Based SharePoint Resource Center

Software Requirements Specification

Group 10

May 14, 2026

Contents

1 Version History

Version	Snapshot	Date	Revision Notes
1.0	Snapshot 1	TBD	Initial requirements, project scope, user roles, and objectives.
1.1	Snapshot 2	TBD	Added role-based content filtering, authentication, and first testing requirements.
1.2	Snapshot 3	TBD	Added office hoteling, attorney workload, expert directory, and analytics requirements.
1.3	Snapshot 4	TBD	Finalized requirements, legal considerations, future work, and acceptance criteria.

2 Introduction

2.1 Purpose

This Software Requirements Specification describes the expected behavior of PD-Intranet, a role-based internal SharePoint resource center for the Santa Barbara County Public Defender's Office. The purpose is to organize office resources, reduce manual permission management, and provide employees with content based on their role.

2.2 Intended Audience

This document is intended for developers, QA testers, project managers, instructors, and future maintainers who need to understand what the system must do.

2.3 Overview

PD-Intranet is a modular SharePoint Framework application using React and TypeScript. It connects with Microsoft identity tools and SharePoint services to display role-filtered content. Users sign in through their Microsoft account and are shown only the pages, tools, and resources that match their assigned role. The system covers features such as office hoteling, attorney workload tracking, an expert witness directory, and role-based resource pages.

3 Overall Description

3.1 User Classes

- General Staff

- Attorneys
- Supervisors
- IT Staff
- Capital Defense Division Staff
- Administrative Staff
- Managers
- External or limited-access users
- System Administrators

4 Functional Requirements

- FR-1 The system shall authenticate users through Microsoft/Azure identity services.
- FR-2 The system shall determine each user's role from Azure Entra ID or Active Directory data.
- FR-3 The system shall display navigation links based on the user's assigned role.
- FR-4 The system shall display role-specific announcements, forms, manuals, and office resources.
- FR-5 The system shall provide an Office Hoteling module for reserving office desks or shared workspaces.
- FR-6 The system shall provide an Attorney Workload module for viewing and searching case distribution information.
- FR-7 The system shall provide an Expert Witness Directory with searchable contacts and availability information.
- FR-8 The system shall provide an Urgency Portal or analytics dashboard for approved supervisor and IT roles.
- FR-9 The system shall prevent unauthorized roles from accessing restricted content.

5 External Interface Requirements

5.1 User Interface

The user interface is web-based and hosted through SharePoint. Users access the system through a SharePoint URL in a browser. After signing in, the interface shows only the pages and tools available for their role. No installation is required on the user's machine.

5.2 Software Interfaces

- SharePoint Framework (SPFx)
- React
- TypeScript
- PnP.js
- Microsoft Graph API
- Azure Entra ID / Active Directory
- Power BI Embedded
- SharePoint App Catalog

6 Non-Functional Requirements

- NFR-1 The system should load main pages within a reasonable time under normal office network conditions.
- NFR-2 The system should support role updates without manual SharePoint permission changes.
- NFR-3 The system should protect sensitive office information through role-based access control.
- NFR-4 The system should be maintainable by future IT staff.
- NFR-5 The system should use modular components so features can be updated separately.

7 Legal and Ethical Considerations

Because the system is intended for a Public Defender's Office, it may involve sensitive staff, office, and case-related information. The following must be considered:

- **User Data:** The system must not store or expose personally identifiable information beyond what is required for role assignment and office directory purposes.
- **Storing Things:** All data is stored within the organization's SharePoint environment. No data is sent to third-party services without authorization.
- **Role-Based Access:** Confidential content (case details, personnel records) must be restricted to users with the appropriate role. Unauthorized access must be blocked at the application level.
- **Moral Responsibility:** Since the office serves clients in the legal system, any breach of data confidentiality could impact active cases or client rights. The system must be designed with privacy and security as a priority.

8 Glossary

Term	Definition
SPFx	SharePoint Framework, a development model for SharePoint customizations.
Azure Entra ID	Microsoft identity and access management service (formerly Azure AD).
PnP.js	JavaScript library used to interact with SharePoint and Microsoft 365 services.
Power BI	Microsoft analytics and dashboard platform.
RBAC	Role-Based Access Control.
AD	Active Directory, Microsoft's directory service for managing users and groups.
SRS	Software Requirements Specification.
UI	User Interface.
IT	Information Technology.
